

## Background image tips

If you create your own background image, you should consider a few points:

- If you chose HiDPI (2x) for the Resolution in the Site Properties dialog box (File > Site Properties), the background image and other images in your site will need to be twice the size it will be on your site. For example, for an image to be 100x100 pixels in Muse, the original image needs to be 200x200 pixels.
- For a single background image that fills the browser window, the image needs to be large enough to fill a larger screen resolution, such as 1366x768 or larger.
- Consider the file size of the background image. One larger image can be much larger in file size and take longer to load into a browser than one small, repeating tiled image.
- If you'll be creating a background image that contains texture, use a low-contrast, subtle texture or pattern to ensure legibility of text content.
- If an image is to repeat in the background, make sure that the edges line up perfectly. You can do this within the program you use to create the background image.
